## The randomized, double blind study phase III.b of the Comprehensive assessment of the musculoskeletal health in children with cystic fibrosis “ on the search for means of improvement

**Code:**

EUCTR2022-002330-13

**Year:** 2022 **Date:**

**Author:**

### Study design (if review, criteria of inclusion for studies)

Controlled: No.1 Randomised: Yes.2 Open: No.3 Single blind: No.4 Double blind: Yes.5 Parallel group: No.6 Cross over: No

### Participants

Principal inclusion criteria: Diagnosis of CF; Age 8-16 years

### Interventions

Main objective of the trial: Maximum recommended doses of vitamin D given over two years to children with CF will normalize bone metabolism parameters and improve bone density and skeletal muscle force.

### Outcome measures

Primary end point(s): The planned examinations will make it possible to assess the effectiveness of vitamin D substitution, possibly adjust the dose, and further assess the degree of risk of fractures, or to start treatment for osteoporosis.
