
primary studies - published RCT

Acute bronchodilator response to a combination of beta-adrenergic and anticholinergic agents in patients with cystic fibrosis.

Code: PM1531677

Year: 1992 **Date:** 1992

Author: Sanchez I

Study design (if review, criteria of inclusion for studies)

Dual intervention cross-over trial over 3 days

Participants

SK score 45 - 90 12 participants (6 males), aged 9 - 22 years

Interventions

Patients received either single dose nebulised placebo, albuterol 5.0 mg or ipratropium 0.25 mg

Outcome measures

Changes spirometry (FVC, FEV1, FEF25-75, FEF50, PEF, FRC, RV, Raw) measured at baseline and 45 minutes post-treatment

Main results

Patients with cystic fibrosis had a better acute bronchodilator response to albuterol and ipratropium bromide than to either drug alone.

Authors' conclusions

Further studies of long-term efficacy and safety seem justified.
