primary studies - published, non RCT

Psychological impact of false-positive results when screening for cystic fibrosis.

Code: PM1782126 **Year:** 1991 **Date:** 1991 **Author:** Tluczek A

Study design (if review, criteria of inclusion for studies)

longitudinal study

Participants

false-positive CF screening parents

Interventions

detailed questionnaire

Outcome measures

parents knowledge of CF NBS program

Main results

Five aspects of parental response to a false-positive CF screening test are addressed: (1) parents' knowledge of the Wisconsin neonatal screening program and the CF screening test, (2) parents' understanding about test results, (3) the effects of screening-related anxiety upon parents' feelings, (4) the effects of false-positive screening results upon reproductive plans, and (5) parents' attitudes about the delayed disclosure of test results in the control group.
