Efficacy and safety of PANCREAZE(R) for treatment of exocrine pancreatic insufficiency due to cystic fibrosis.

Code: PM21632288

Year: 2011 **Date:** 2011

Author: Trapnell BC

Study design (if review, criteria of inclusion for studies)

randomized, placebo-controlled study

Participants

n=49

Interventions

Participants (n=49) entered an open-label, ≤ 14 day run-in phase, maintained a high-fat diet (100 \pm 15 g/day), and received PANCREAZE(R) (10.5 or 21). Participants with a coefficient of fat absorption (CFA) $\geq 80\%$ (n=40) were then randomized (1:1) to receive either PANCREAZE(R) or placebo during a double-blind,

Outcome measures

fat absorption, protein absorption, adverse events

Main results

PANCREAZE(R) improved fat absorption as shown by significantly lower mean \pm SD change in CFA between open-label and double-blind phases for PANCREAZE(R) (-1.5 \pm 5.88%; p

Authors' conclusions

This study demonstrated PANCREAZE(R) was effective in treating EPI due to CF and was safe and well tolerated.
