primary studies - published RCT

Efficacy response in CF patients treated with ivacaftor: Post-hoc analysis.

Code: PM25755212 **Year:** 2015 **Date:** 2015 **Author:** Konstan MW

Study design (if review, criteria of inclusion for studies)

data from Phase 3 studies (STRIVE/ENVISION) - post-hoc analysis

Participants

CF patients (nâ€‰=â€‰209)

Interventions

Post-ho analysis of patients (nâ€‰=â€‰209) who received 48 weeks of ivacaftor or placebo. Patients were assigned to tertiles according to FEV(1) response.

Outcome measures

FEV(1), sweat chloride, weight, CFQ-R, and pulmonary exacerbation

Main results

The number needed to treat (NNT) was calculated for specific thresholds for each outcome. Across all tertiles, numerical improvements in FEV(1), sweat chloride, CFQ-R and the frequency of pulmonary exacerbations were observed in ivacaftor-treated patients: the treatment difference versus placebo was statistically significant for all outcomes in the upper tertile and for some outcomes in the lower and middle tertiles. The NNT for aâ€‰â‰¥â€‰5% improvement in %predicted FEV(1) was 1.90, for aâ€‰â‰¥â€‰5% body weight increase was 5.74, and to prevent a pulmonary exacerbation was 3.85.

Authors' conclusions

This analysis suggests that the majority of patients with clinical characteristics similar to STRIVE/ENVISION patients have the potential to benefit from ivacaftor therapy.
